

Relative Equilibrium

Question 1: A tank which has a liquid with a specific weight $\gamma = 9.22 \text{ kN/m}^3$ inside it has an upward constant acceleration of 4.8 m/s^2 . Depth of the liquid in the tank is 0.9 meters. Dimensions of the base of the tank are 1.20×1.50 meters. Find the pressure and the pressure force at the base of the tank.

- When the tank is accelerating,
- After the tank's acceleration dies out and when it keeps moving upward with a constant velocity of 6 m/s ,

Answer:

a- $F = 22.26 \text{ kN}$ b- $F = 14.91 \text{ kN}$

Question 2: A container that is partially filled with water is dragged with an acceleration of $a=4 \text{ m/s}^2$ at an angle of 30° with horizontal plane. Given that the container's base width is 4 meter and the depth of the water before motion has started is 1.5 meter,

- Calculate the angle of the water's surface with horizontal plane.
- Calculate the maximum and minimum pressures on the base (bottom) of the container.

Answer:

a- $\Theta=16.347$ b- $\sigma_{\max}=24.72 \text{ kN/m}^2$ $\sigma_{\min}=10.79 \text{ kN/m}^2$

Question 3: The depth of water in an open-topped cylindrical container is 1.5 meter. The container is being rotated with angular velocity ω around its own axis.

- Calculate the maximum angular velocity of the container that could be attained without spilling the water.
- Calculate the maximum angular velocity that could be attained while keeping the water depth above the container's axis to be $Z_0 = 0$.
- Find the pressure values on the bottom and on the sides B and C for $\omega= 6 \text{ rad/s}$.

Note: Volume of the paraboloid is half of the cylinder's volume that is built right on it.

Answer 3: a) $\omega_{\max} = 8.86 \text{ rad s}^{-1}$; b) $\omega = 15.34 \text{ rad s}^{-1}$; $p_{\text{eksen}} = 1.27 \times \gamma = 12.46 \text{ kN/m}^2$ and

$$p_{\text{cidar}} = 1.73 \times \gamma_{su} = 16.97 \text{ kN/m}^2$$
